

ENSER & CARPAL KINETICS

Team Up For Revolutionary New Design of Product

Wristrac - The non-surgical treatment for Carpal Tunnel Syndrome and other wrist related disorders

Wristrac™ was developed by Ronald M. Repice, M.D. and Ronald M. Repice II, D.C. back in 1995 to provide a non-surgical solution for Carpal Tunnel Syndrome (CTS) and other wrist related disorders. Wristrac is designed to reduce the compressive and contractile forces in the wrist specifically in the region of the Carpal Tunnel, where the Median nerve and surrounding muscles and ligaments become damaged.

Wristrac™ provides a directly controllable traction force across the wrist, causing a stretch on the bones, muscles and ligaments allowing more room for the median nerve as well as reducing surrounding scar tissue that may have formed, thus relieving nerve pressure in addition to increasing blood flow (circulation of oxygen to the hand) which will allow for normal nerve function.

- ✦ Easy to use at home or work
- ✦ Lengthen contracted & thickened tissue
- ✦ Increase proprioception
- ✦ 7 Powerful yet controlled traction settings
- ✦ Provide patients with a non-surgical treatment for wrist pain
